- Salesforce Certified Advanced Administrator
- Salesforce Certified Platform App Builder

THIS LETTER COVERS

Details that would not fit the resume — the *why* behind the career, the engineering methodology, and what I bring to day one that no recruiter summary will capture.

> *"The code either works or it doesn't. The architecture either holds production load or it doesn't. AI is the execution engine — I am the architect."*

PORTFOLIO

- apex-patterns — TriggerHandler, service layer, callouts
- lwc-component-library — Flow-compatible UI components
- salesforce-integrations — SAP DQM, REST, event-driven
- ai-engineering — Prompt architecture, LLM callouts
- twiddle-box — Active platform in development

Cover Letter

June 2026

Hiring Team
[Company Name]

Dear Hiring Manager,

My resume says **Senior Salesforce Administrator**. That is the title I held. It is not the role I performed. Over 4.5 years at iFIT — a global fitness brand running 1,000+ Salesforce users across seven countries — I became a Salesforce full-stack Developer, AI engineer and solutions architect for one of the most technically demanding Salesforce environments I have encountered. I designed and shipped production Apex callout classes, RESTful endpoints, Data Transfer Objects, and a 15-component LWC library with custom Property Editors. I authored Flow XML at the metadata layer. I ran the SAP DQM address-validation pipeline end to end. I did this without formal authority to call myself a developer — and the work speaks for itself either way. **Code works or it doesn't.**

My career trajectory is not an accident. It is the result of a deliberate, compounding investment in platform depth. At Monumetric, I built a tri-directional Jira / Salesforce / Slack integration from scratch during the technical interview — zero prior formal Salesforce experience, zero third-party tools, secured the hire, and walked out with a COO-acknowledged developer title. At TaskEasy, I architected a Jira-style sprint board object inside Salesforce and built live AWS data pipeline integrations as a sole architect with no external support. At iFIT, I added seven clouds, a full AI engineering practice, and built the Salesforce multi-cloud delivery capability from the inside out. Each role was hired one level below what I was operating at. That gap closes here.

The AI engineering component of my background is the part that is hardest to represent on a resume, so I want to be direct about it. I have not taken a certification course or read a book on prompt engineering. I have **designed and run production AI workflows** — with multiple custom AI models running in parallel, governed by a shared sprint contract that coordinates independent work phases — on real technical problems with real architectural stakes. I developed a proprietary grounding framework that prevents context drift in long AI sessions. I authored a Python/Node.js MCP server that delivers local file system access to AI models directly in the IDE. I architected a full multi-stage data migration using custom AI orchestration. This methodology is private IP I maintain as personal competitive advantage — and I am actively deploying it on my independent platform, **Twiddle Box Development**, which makes production-quality Salesforce development accessible at scale to organizations that cannot afford a developer. That work is in pre-alpha, it is live, it is real, and it is the clearest possible signal of where I operate when left to my own architectural direction.

What I bring to day one is not a promise — it is a pattern. I have never had a peer to benchmark against. Every production Apex class, every LWC component, every Flow XML injection, every AI workflow was built in isolation with no formal training budget and no architect in the seat above me. I built that seat. I am looking for an organization where the role matches the work — and where I can stop explaining the gap between title and output.

> *My GitHub portfolio at **github.com/jrhogan77** contains production-ready code across five repositories — Apex patterns, LWC components, integration architecture, AI engineering, and platform development. Every class, every component, every pattern was written to the standard I hold in production.*

With genuine appreciation for your time and consideration,

Jason Hogan
